Making an Impact

An estimated $30 billion in benefits since 2007 from foundational investments (connected health information, telehealth and telehomecare, drug information systems, diagnostic imaging, and physician and ambulatory clinic electronic medical records). An increase of $4.5 billion in the past year.

In 2019, 7 in 10 Canadians can access some of their personal health information electronically (up from 2 in 10 in 2015). 3 in 10 can access multiple parts of their record in a single solution.

More than 425,000 Canadians now use patient portals, including 400,000 new users in 2018-2019.

More than 40,000 Canadians have been enrolled in telehomecare programs since 2010.

More than $420 million in avoided expenses and more than 280 million kilometres in travel saved by using telehealth to access specialized care such as for mental health and stroke patients in rural and remote communities.

An estimated 210,000 health care professionals access clinical information integrated into their point-of-care systems.
